NATURE AND TECHNOLOGY IN BALANCE

Letter of Recommendation: Suzanne Chappelle's Earthing Coils

Dear Sir/Madam,

I am pleased to announce that Suzanne Chappelle's Earthing coils (E-coils) have yielded positive and significant results in the following experiments and tests. All tests have been conducted in a strictly controlled environment by professional scientists.

Plants: effects observed (compared to control) - better developed root system, including mass and physiology of roots, higher germination rate, improved metabolism (less nutrients needed for equivalent biomass and/or harvest yield)

Water: Changes in electric properties (electrical impedance, conductivity), optical properties (changes in NIR and VIS spectrometric measurements) and physical properties (pH, surface tension, viscosity)

In the upcoming 6 months we will conduct further tests, including effects on gene cloning, gene expression and cell tissue culture growth.

Although it is too early to determine the mechanism of action, it is clear that the effects are solid and can be compared to different high-tech devices that are more expensive to produce and implement.

Sincerely,

Tomas Kunstmonas
